

THE EXOTIC ASSET COMPANY

Spice

The autonomous hedging & risk desk for ordinary businesses.

We find the commodity, cash and climate risk hiding in an ordinary SMB's books — and hedge all three autonomously, the way only a Fortune 500 trading desk could.

Every SMB is a commodity trader who doesn't know it.

A bakery thinks it buys flour, butter and electricity. It is actually **long wheat, long gas, long fats, long power**. A trucking firm is long oil; a metalworker is long steel and aluminium — massively exposed, unhedged, blind to it.

HEDGEABLE COMMODITY	HIDDEN INSIDE THESE SMB INPUTS
Wheat • Fats	flour, bread, butter, cream, animal feed
Gas • Oil	oven fuel, cement, glass, plastics & polymers, transport, diesel
Electricity	glass, electric-arc steel melting, refrigeration
Steel • Aluminium • Copper	structural metal, fittings, hardware, roofing, construction

Nobody else connects "a boulangerie in Lyon" to "long wheat + gas" — and acts on it. That translation layer is the start of the moat.

The giants are laying the rails and looking for the use case.

Stripe (Bridge) cracked agentic, stablecoin-native commerce. Circle is building programmable money for the real economy — its CEO is personally pushing real-economy use on its own chain, Arc.

WHAT EXISTS

Programmable money, on-chain credit, 24/7 settlement. Stripe and Circle proved the rails work.

WHAT'S MISSING

A real-world use case and a way to reach the ground. Arc's first movers (Meridian, Firmata) are crypto-native, with zero real-economy distribution.

WHAT SPICE ADDS

The use case — hedging an SMB's commodity book — and the channel: accountants who already advise these businesses.

We don't have to invent demand or build the rails. We connect **rails that already exist** to **businesses that already need them**.

It doesn't show up as a line item. It shows up as running out of cash.

COMMODITY SPIKE

874 French bakeries entered insolvency in 2022 — **+124.7% YoY** — after flour rose ~40% and energy spiked. They didn't lose on a trade; they ran out of cash.

IDLE CASH

UK SME current-account balances grew **£63.7B → £124B** (2013—2024), at low or zero yield while inflation erodes them.

CLIMATE SHOCK

54 of France's 96 departments hit red heat alert this week; construction productivity under heat stress falls **29—41%**.

Metals get hit twice. Steel and aluminium are volatile, working-capital-heavy inputs — a swing hits what a metalworker buys *and* what sits in the yard. The World Bank sees the metals index **+17% in 2026** (aluminium/copper/tin ~+20%).

No one fixes this — hedging always needed a desk and a size these businesses don't have.

Spice covers all three, autonomously, at SMB size.

Spice turns a P&L into a risk book it can actually manage.

It decomposes the cost structure into the exposure underneath — **"41% wheat, 22% energy"** — forecasts the margin hit from historical commodity-price variation, then hedges across three venues, **one per risk**. No human spots the exposure, prices it, or calls a broker.

INPUT COST → OPTIONS

Calls on regulated commodity ETFs (wheat / gas / oil) via Alpaca. Caps the input-price spike.

IDLE CASH → YIELD

Sweeps idle cash into on-chain lending (Aave / Morpho) instead of letting inflation erode it. Recallable.

CLIMATE → INSURANCE

Parametric escrow pays out automatically when a price or weather index crosses a trigger — no adjuster, no claim.

A bakery, a trucking firm or a metalworker gets the **same risk desk a Fortune 500 treasury has** — in the background, settling in stablecoins, 24/7.

The rails, the brain and the volatility all arrived together.

① PROGRAMMABLE MONEY EXISTS

Stripe (Bridge) and Circle cracked stablecoin rails. Add commodity-ETF options, on-chain lending and parametric escrow — a business can hold a hedge, a yield position and a policy with **no broker and no minimum ticket**.

② AGENTIC AI RUNS THE DESK

A model can now read a P&L, decompose it into exposure, forecast the shock and execute across venues **with no human in the loop** — a turnkey agent loop that didn't exist a couple of model generations ago.

③ THE WORLD GOT MORE VOLATILE

Brent jumped **\$72 → \$118** in a single month this quarter; gold is **+42%** on the year; 54/96 French departments on red heat alert. The risk is spiking on all three fronts at once.

The rails were payments-only until now. Nobody built the layer on top that actually **uses them to manage risk** — right as the risk got worse and the tools to manage it arrived.

A 2026 heatwave hits one bakery three ways. Spice caught all three.

① INPUT PRICES SPIKE

Wheat +38%, gas +25%. **Options leg** caps the damage.

② IDLE CASH STRANDED

Morpho leg earned yield on the buffer, recalled on demand.

③ FOOTFALL + FRIDGES

No tradeable price. **Parametric escrow** pays out on-chain, instantly.

SMB + ACCOUNTANT DISCOVERY INTERVIEWS (YIELD)

Per-business, a hedging tool. At scale, irreplaceable.

CASH POOLING

Pooled SMB liquidity gets hedge pricing & execution no single small business could.

DATA POOLING

The real cost structures, margins and commodity exposures of millions of ordinary businesses — in real time, at the micro level.

THE ENDGAME

A live, ground-truth map of the real economy. Worth more to **hedge funds & central banks** than the SaaS ever will be.

The wedge sells hedging to SMBs. The company sells **the real economy's nervous system** to the people who move markets. → the décacorn.

Real quant. Real on-chain execution.

THE BRAIN

A Claude Opus 4.8 agent loop with five live tools over `quant.py`: cost decomposition → shock propagation → before/after margin VaR. Real math, not a chat box.

THE RAILS

Alpaca options (real OCC contract, paper) • Morpho ERC-4626 yield • an on-chain parametric escrow that settles its payout live on testnet during the demo.

THE TEAM

5 builders — one quant, two founders (built YIELD), one frontend/data, one fullstack + blockchain.

Everyone else demos a chat box over a spreadsheet. We turn a boulangerie into a hedge fund — and show the macro endgame.

THE KILLER LINE

Stripe and Circle made dollars programmable. We make **the real economy** programmable.

We find the commodity, cash and climate risk hiding in an ordinary business's books and hedge it on rails that were payments-only until now.
